HOUSE PRICE PREDICTOR

TEAM VORTEX

Rahul Rimal

Bilakshana Neupane

PROBLEM STATEMENT

"House prices are influenced by multiple factors, making accurate prediction challenging. This project develops a reliable model to estimate prices based on key housing features."

OBJECTIVE

To predict **median house value** using given features

To identify important factors affecting **house prices**

To apply **ANOVA** for statistical analysis

DATASET

kaggle

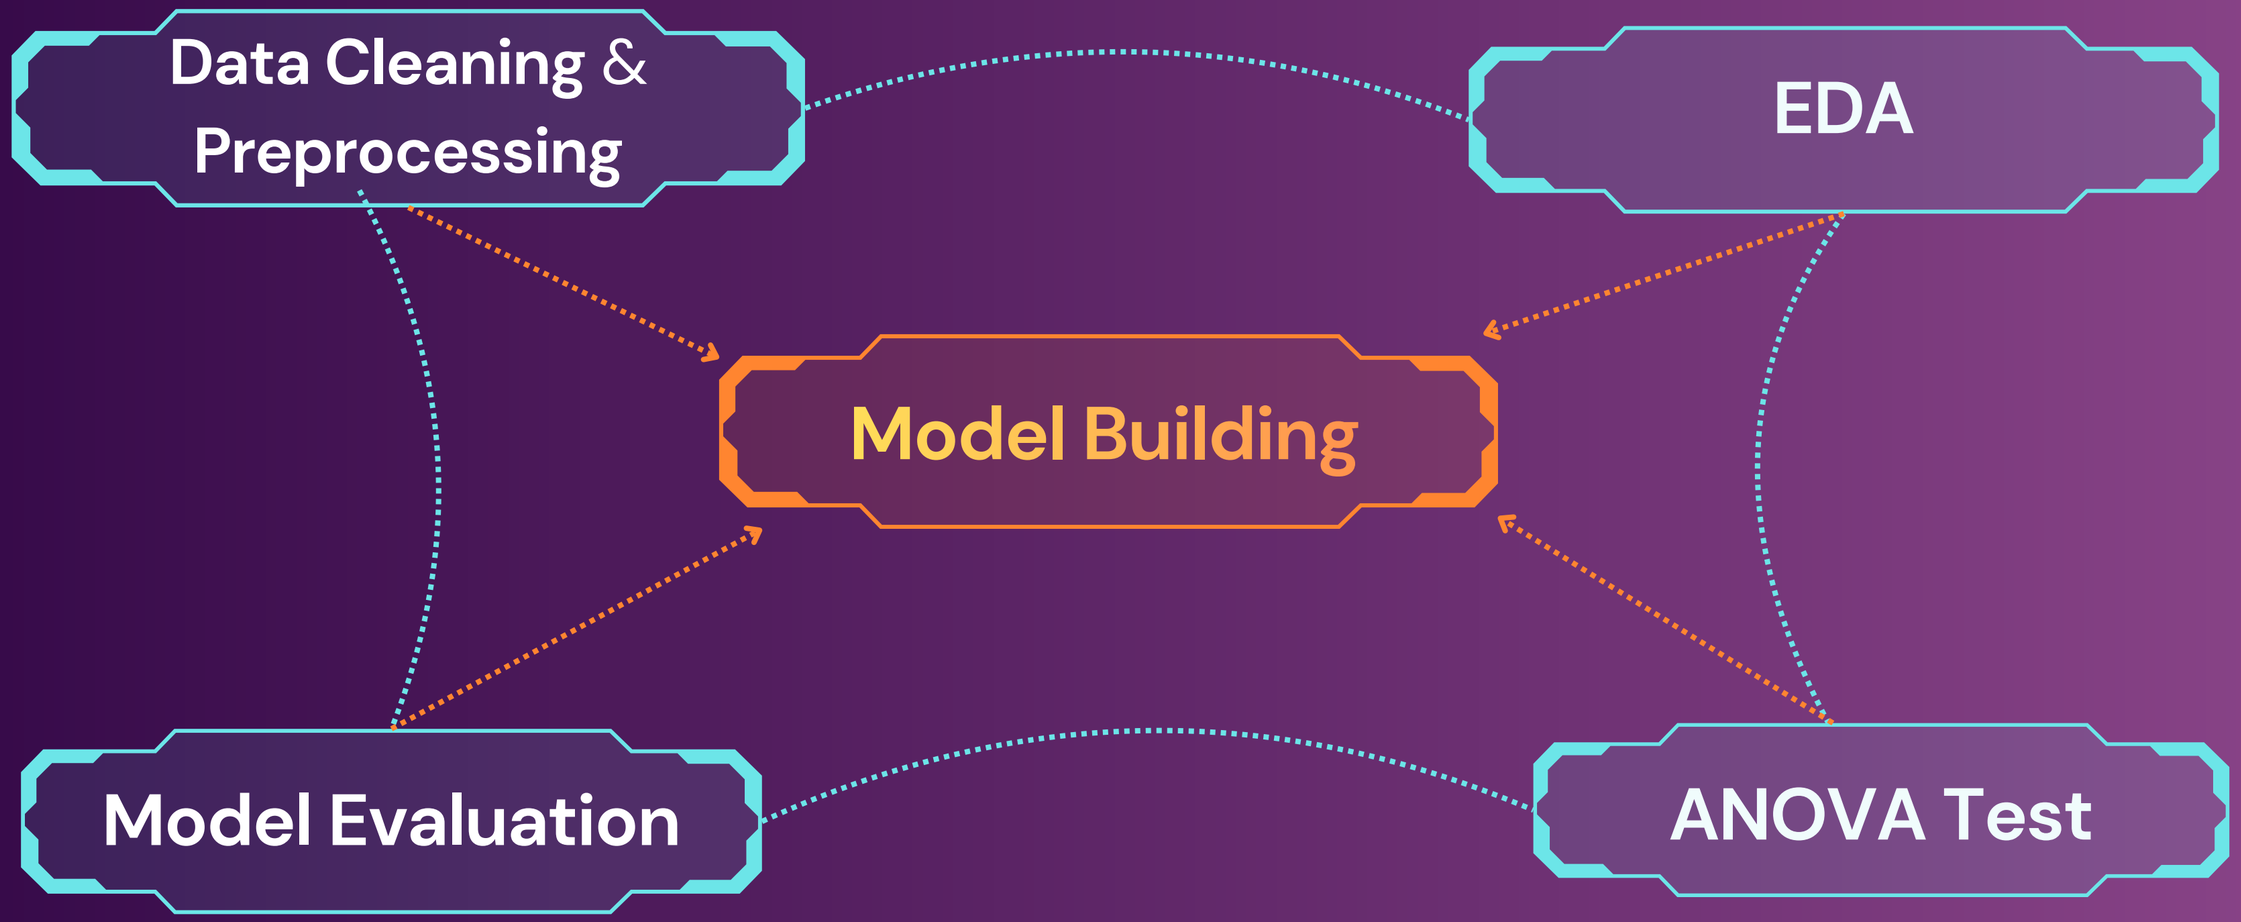
FEATURES USED

Target Variable

median_house_value

- longitude
- latitude
- housing_median_age
- total_rooms
- total_bedrooms
- population
- households
- median_income
- ocean_proximity

METHODOLOGY



MODELS USED

Multiple Linear Regression

- Suitable for continuous target variable
- Interpretable coefficients
- Aligns with statistical modeling objectives of the course

CONCLUSION

> This project combines statistical analysis to predict house prices. ANOVA helps identify significant variables, and regression model is used to make accurate predictions.
